

# 6 Types of Malignant Neoplasms

By: Kiara Hohenberger

# Why this project?

- Cancer affects every family in one way or another. Knowing that led me to be confident that cancer is what I wanted to research in my project.

# Problem

Problem- The problem I see in the world today is many know the term cancer, but very few have any knowledge beyond that.

# Hypothesis

By providing basic information about malignant neoplasms to the general public, more awareness can be brought to the situation, as well as the risk factors involved.

# Questions

The questions I asked myself are what are the 6 types of malignant neoplasms? How is each categorized/diagnosed? And what are the best statistical treatment options for each type of cancer?

# What will I learn from this project?

Threw the duration of this project, you will develop a basic understanding of each of the 6 types of malignant neoplasms as well as how each is categorized, the risk factors for each, and what treatments have the best statistical chances of success.

# What are the 6 Types of Malignant Neoplasms?

- Carcinoma
- Leukemia
- Lymphoma
- Melanoma
- Myeloma
- Sarcoma

# Where does each malignant neoplasm form?

Carcinoma- Forms in the tissue lining of the body.

Leukemia- Forms in the blood-forming tissues.

Lymphoma- Forms in the lymphatic system.

Melanoma- Forms in the melanocytes.

Myeloma- Forms in plasma cells.

Sarcoma- Forms in the bones and soft tissues.

# Conclusion

In conclusion, the 6 types of malignant neoplasms are carcinomas, leukemia, lymphomas, melanomas, myelomas, and sarcomas. As this project is being disseminated into the world, a general knowledge of malignant neoplasms can build a foundation for understanding the risk factors, as well as what to look out for in yourself and others around you.
